

Academic Honor Statement

Introduction to Coding (Python)

This course is designed to help you build **real, authentic coding ability**. Those skills only grow when the work is genuinely your own. This statement is a promise — to yourself, your classmates, and your instructor — that you will do your own thinking and be able to explain everything you turn in.

You will sign this in **Week 1** and keep it for the full semester.

MY COMMITMENTS AS A STUDENT

By signing below, I agree that for the entire duration of this course:

1. **I will do my own work.** All homework, projects, and research-paper milestones will be written by me, in my own words and my own code.
2. **I will not submit AI-generated code or content.** I understand that using AI tools to generate my assignments is not allowed in this course.
3. **I can explain everything I submit.** If asked, I will walk through any part of my work and describe how and why it works.
4. **I will keep an honest commit history.** I will commit my work progressively through GitHub so my process is visible, rather than uploading everything at the last minute.
5. **I will ask for help the right way.** I may ask my instructor, classmates, and approved course resources for guidance and debugging help, but the final work will be my own.
6. **I understand how authorship is checked.** Commit history and short in-class code walkthroughs are used to confirm that I understand my work.
7. **I understand the consequences.** Any submission I cannot explain may be reassessed in class, and repeated violations follow the school's academic integrity policy.

WHAT COUNTS AS ALLOWED HELP

To keep expectations clear:

Allowed

- Asking the instructor or a classmate to help you understand an error message.
- Reading official documentation, course handouts, and approved resources.
- Discussing ideas and approaches, then writing your own code.
- Using a search engine to learn a concept.

Not allowed

- Pasting an assignment prompt into an AI tool and submitting its output.
- Copying another student's code and presenting it as your own.
- Turning in work you cannot read, run, or explain.
